

All removals (deletion of user, product, event, person from event, group, person from group, reminder, whatnot -- and signified by the lovely big X) will get a dialogue box along the lines of the delete user and delete person from event example, but wireframing those would have either (a) obscured other details on that particular wireframe or (b) would have resulted in ridiculous redundancy.

Ajax autocomplete of Event name (and date for public and religious holidays) and of Person names for recognised names/events. Recognised (pre-populated in database) event names (e.g. holidays, wedding, anniversary, graduation, birthday) will be noted as annual or not. Dialog box with ('Is this an annual event?') for unrecognised events.

Deletion of all people from an event will also delete the event. Reminders can be removed either from the edit settings or by clicking on the alarm clock. (Clicking again on a deactivated 'alarm' will re-activate it with previous settings (if any) or will direct user to edit events (if no reminder settings).
